

Runner Manager Problem Statement

Beatrice is an experienced runner manager who needs to track her fleet, assign deliveries efficiently, and respond quickly to delays. However, she lacks real-time visibility of runner locations and order statuses, leading to delayed responses and customer complaints. Communication with runners is also disjointed across multiple channels, making operations harder to manage.

1. How might we centralize fleet tracking for Beatrice so that she can monitor runner locations and statuses in real time?
2. How might we automate task assignment for Beatrice so that she can match runners to deliveries more efficiently?
3. How might we surface delay alerts to Beatrice so that she can intervene before customers complain?
4. How might we unify communication channels for Beatrice so that she can manage all runner conversations in one place?
5. How might we generate performance insights for Beatrice so that she can make better decisions based on delivery history?
