

Runner Problem Statement

Kevin is a reliable and experienced delivery runner who wants to complete tasks quickly and fairly. However, he often receives inefficient or distant delivery assignments, struggles with unclear customer instructions, and has no easy way to update the customer or manager during delays. This causes stress, slows him down, and negatively affects his performance.

How might we questions;

1. How might we optimize route assignments for Kevin so that he receives fair and efficient deliveries?
2. How might we improve task clarity for Kevin so that he always understands where to go and what to deliver?
3. How might we enable real-time updates for Kevin so that he can inform managers and customers when delays happen?
4. How might we simplify communication tools for Kevin so that he doesn't need to switch between apps during delivery?
5. How might we allow Kevin to preview upcoming tasks so that he can plan his route more effectively?
